In this analogy, the lock is the enzyme and the key is the substrate. Only the correctly sized key (substrate) fits into the key hole (active site) of the lock (enzyme) . Smaller keys, larger keys, or incorrectly positioned teeth on keys (incorrectly shaped or sized substrate molecules) do not fit into the lock (enzyme).

In 1958, Daniel Koshland suggested a modification to the lock and key model. Since enzymes are rather flexible structures, the active site is reshaped by interactions with the substrate. As a result, the substrate does not simply bind to a rigid active site.

2 The Lock-and-Key Principle. Figure 1. Lock and keys from the last 100 years: (a) key from 1853; (b) safety lock and key; and (c) magnetic tape as a key, seems to be of interest. It has a well-defined hydrophobic cavity. It readily forms a complex with chlorobenzene but not with bromobenzene (Figure 2).

The lock-and-key concept is discussed with respect to necessary extensions. Formation of supramolecular complexes depends not only, and often not even primarily on an optimal geometric fit between host and guest. Induced fit and allosteric interactions have long been known as important modifications.

The lock and key principle in immunodiagnosics Immunodiagnosics follows an important basic principle of the human immune system: development of antibodies against foreign substances (known as antigens). Antibodies bind as exact fits to their antigens. This is known as the lock and key principle.

lock-and-key mechanism A mechanism proposed in 1890 by Emil Fischer (1852–1919) to explain binding between the active site of an enzyme and a substrate molecule. The active site was thought to have a fixed structure (the lock), which exactly matched the structure of a specific substrate (the key).

The key serves as a security token for access to the locked area; only persons having the correct key can open the lock and gain access. In more complex mechanical lock/key systems, two different keys, one of which is known as the master key, serve to open the lock. Common metals include brass, plated brass, nickel silver, and steel
